

How to use ROS development studio

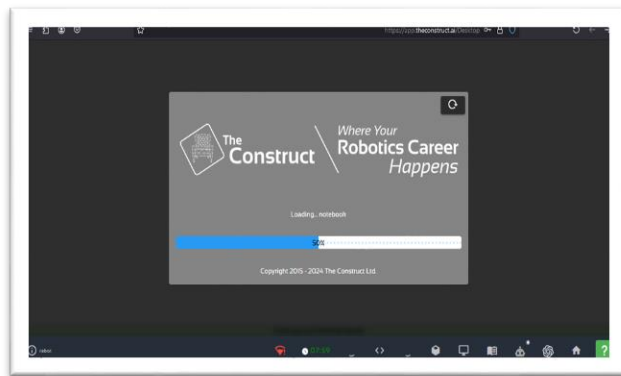

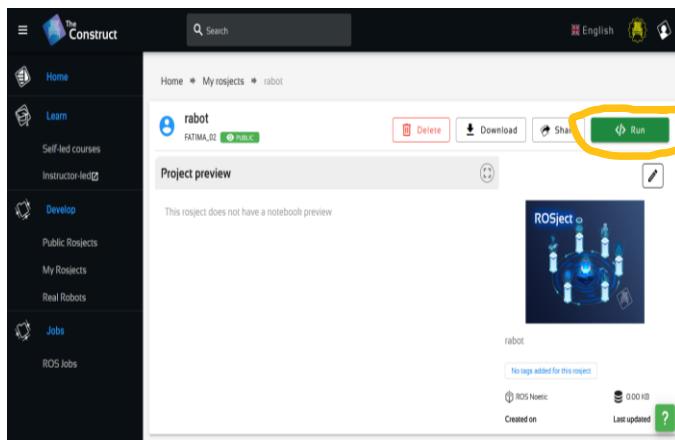

1. First, you need to create an account, and then we will start creating a new project.

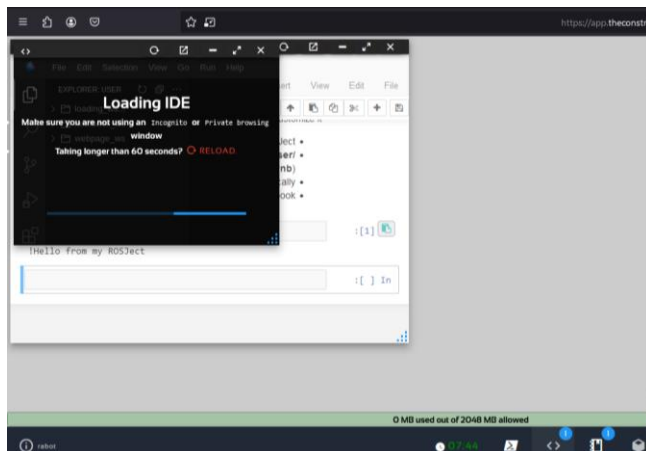

2. You can name and describe the project and choose ROS version you want

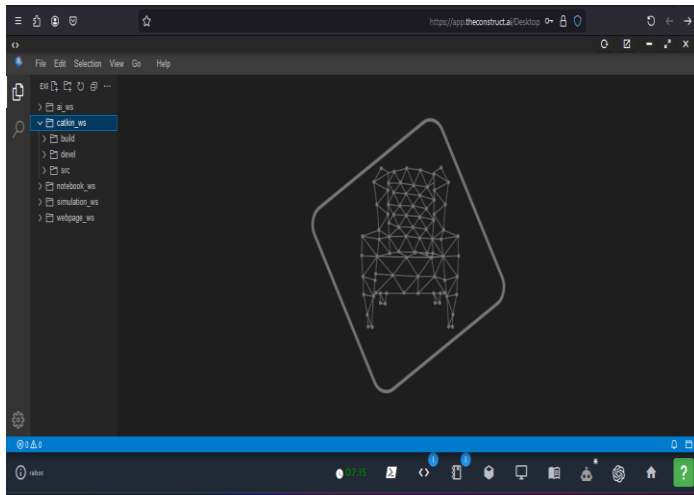

3. Here we got the description and the project and we started clicking on Run

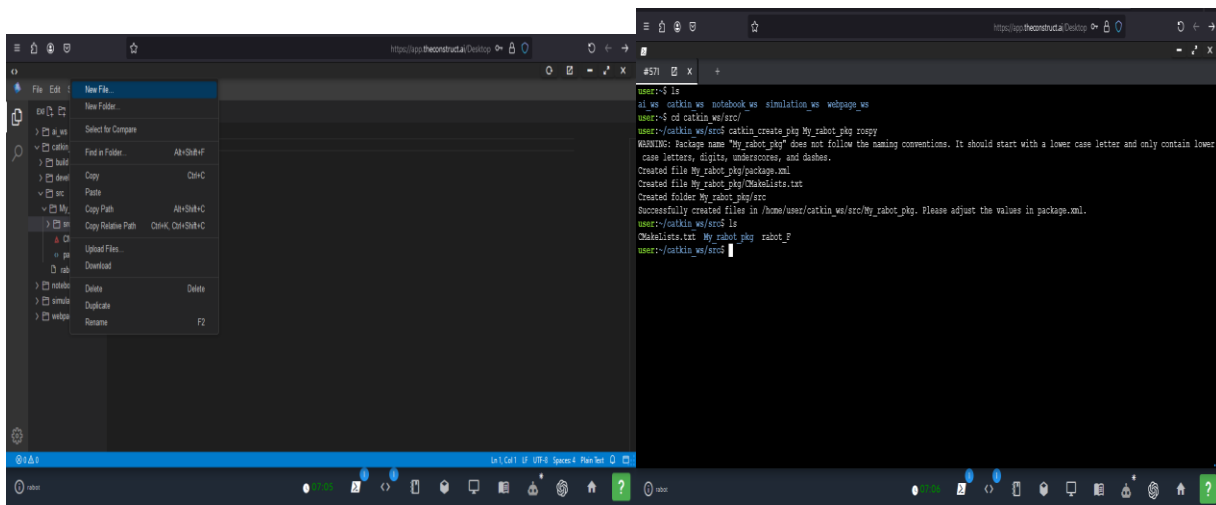

4. We'll start with the tools. We'll use the IDE we have here

From here we can open a new file and it can also be add the robot's shell

You can choose the programming language through shell here. For the example, I chose the python language

If you are interested in simulation, if you can see the monitor window appear and then run it.
